Model Reliability & Scraping Artifacts

The CatBoost regressor performs optimally on conventional internal combustion vehicles but exhibits significant bias when encountering noisy scraped features on electric vehicles:

- Critical Data Anomalies Discovered:**
- Invalid Feature Combinations:** Scraped rows indicating a "Manual" Tesla Model Y or a "Petrol" Tesla Model 3 introduce structural noise, misleading tree splits and depressing valuation outputs.
 - Chronological Faults:** A "2013 Tesla Model Y" represents a non-existent vehicle configuration year, causing the model to penalize value due to synthetic over-aging.
